The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV98090 to Exceptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV98000 trepresent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98866 and AAV98867 to V9978 represent hammerhead ribozymes and harrpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit call proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to treatment of cancers and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                          ô
position -308. The DNA was isolated from the blood sample of patients suffering from chronic hepatitis B virus (HBV) infection. This is used in suffering from assessing the probable outcome of treating a subject a novel method for assessing the probable outcome of treating a subject suffering from a persistent virus infection with a cytokine. The method determines whether the subject carries one or more alleles (TNF-alpha allele 1 or 2) associated with therapeutic response when treated with the cytokine by isolating the DNA from the infected patients followed by PCR amplification and detecting the TNF alpha promoter alleles by dot blot hybridisation. The method is used to predict the outcome of persistent hybridisation in a subject, as well as the outcome of cytokine therapy (particularly interferon therapy) in patients suffering from chronic hepatitis infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for

This method detects the presence of a point mutation in a specific sequence of a target nucleic acid. The method comprises using a probe which is labelled at 5' and 3' ends with 2 different labels that form fluorescent resonance energy transfer (FRET). The ratio of fluorescence between both fluorescent dyes at the maximum fluorescent absorption wavelength is measured. The fluorescence ratio indicated the

This is the nucleotide sequence of the PCR primer used for amplification in the method of the invention, which involves modulating the expression of hepatic nuclear factor or other diabetes related gene. The method is used to treat early onset type II diabetes and defects in insulin secretion. It is based on the discovery that certain mutations in the HNF1 gene, encoding a transcription factor, are involved in these

    useful for, e.g. modulating
or other diabetes-related gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide probes AAV29709-48 were used to exemplify the method of the invention. This method detects the presence of a point mutation in a specific sequence of a target nucleic acid. The method comprises using a probe which is labelled at 5' and 3' ends with 2 different labels that form fluorescent resonance energy transfer (FRET). The ratio of fluorescence between both fluorescent dyes at the maximum fluorescent absorption wavelength is measured. The fluorescence ratio indicated the ratio of target/probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detection of point mutation and detection of gene abnormality - using probe with base sequence and fluorescent dye.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This is the nucleotide sequence of the PCR primer used for amplification in the method of the invention, which involves modulating the expression of hepatic nuclear factor or other diabetes related gene. The method is used to treat early onset type II diabetes and defects in insulin secretion. It is based on the discovery that certain mutations in the HNFI gene, encoding a transcription factor, are involved in these

    useful for, e.g. modulating
or other diabetes-related gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 12.2; DB 1; Length 17; Pred. WO9950403-AZ

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1675 to Gene, and AAA1760 and AAA1762 represent ribozyme sequences for ARNY, and AAA17164 tepresent tribozyme sequences; AAA1764 represent tribozyme sequences; AAA19155 to AAA19155 to AAA18185 to AAA18186 to AAA19086 and AAA19155 to AAA1922 represent their corresponding target sequences; AAA19233 to AAA21595 to AAA1922 represent ribozyme sequences for integrin alpha 6 subunit, and AAA2169 to AAA21500 and AAA21699 to AAA21699 to AAA21596 to AAA21596 to AAA21595 to AAA213342 represent ribozyme sequence for integrin subunit beta 3, and AAA23342 represent ribozyme sequence of integrin subunit beta 3, and AAA23475 to AAA23343 to the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding anglogenic factor, especially ARNY, contegrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are mecular degeneration (ARND), inflammation, and arthritis, as well as mecular degeneration (ARND), inflammation, not arthritis, as well as madicitibroma of tuberous sciences, pot-wine stains, sturge Weber conduction, and arthritis, as well as and diseases related to the stains, trie-2, integrin subunit alpha-6, or the stains, sturge weber conduction, and alpha-10, the syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, integrin subunit alpha-6, or the erelated to the syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-1 Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors. Mcswiggen JA; integrin subunit alpha-6, or integrin subunit beta-3 Sequence 17 BP; 5 A; 2 C; 6 G; 0 T; 4 U; 0 Other; Coeshott C, Claim 53; Page 63; 305pp; English. The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl widractoring activity, which specifically cleave RNA encoded by an aryl gene, an integrin subunit betea 3 gene, an integrin subunit betea 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17168 to AAA17680 and AAA17681 represent their corresponding target sequences; AAA17685 to AAA1985 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19087 to AAA19223 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA21688 represent their corresponding target sequences; AAA21689 to AAA21685 and AAA218342 to AAA23343 to AAA23262 represent their corresponding target sequences; AAA21689 to AAA22475 and AAA23462 to AAA23343 to AAA2346 to AAA2346 to AAA23462 represent their corresponding target sequences for integrin subunit beta 3, and AAA2346 to AAA23343 to AAA2346 to AAA2346 to AAA2348 and AAA2346 to AAA2348 and AAA2346 to AAA23343 to the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNY, integrin subunit beta 3, integrin subunit alpha-6, or Tie-2, They are especially used to treat cencer, diabetic retinopathy, age related macular degeneration (ARN), inflammation, and arthitis, as well as neovascular glaucome, myopic degeneration, psoriasis, verruca vulgaris, and other syndrome, Kippel-Trenaunay Weber syndrome, osler.Weber-Rendu syndrome, sand diseases related to the levels of ARNI, Tie-2, and other syndromes and diseases related to the levels of ARNI, Tie-2, incorring conting the syndrome of the levels of ARNI, the levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17 BP; 0 A; 4 C; 8 G; 0 T; 5 U; 0 Other;

New oligonucleotide targetting human N-ras nucleic acid - is capable of inhibiting human N-ras expression, useful for preventing or treating conditions arising from the activation of a human N-ras oncogene.
                                                                                                                                                                                                              Disclosure; Page 35; 97pp; English

The invention relates to oligonucleotides, which target a mucleic acid encoding human N-ras, and are capable of inhibiting human N-ras expression. The antisense oligonucleotides form a pharmaceutical composition, which is useful for modulating the expression of human N-ras, inhibiting the proliferation of cancer cells, and preventing or treating conditions arising from the activation of a human N-ras oncogene. The oligonucleotides are also useful in diagnostics, therapeutics, and as research reagents and kits. The oligonucleotides henable the specific modulation of activated human N-ras expression, which is associated with tumour formation. Sequences AAX21620-633 represent antisense oligonucleotides complementary to human Ki-ras

Liposome-encapsulated oligonucleotides useful for treating or preventing

Example 1; Page 113; 120pp; English.

cancers associated with ras gene activation

This invention describes novel compositions comprising oligonucleotides (AAX56957-X57017), entrapped within liposomes, that hybridize specifically to a target DNA or maNA which encodes a murent or wild-type ras protein. The products of the invention have anticancer activity and specifically bring about the antisense inhibition of ras genes or mRNA. The products of the invention are used to modulate expression of a ras gene in cells, tissue, organs or organisms, particularly to inhibit cell growth and especially to treat or prevent cancers associated with activation of a ras gene. Encapsulating the oligonucleotide reduces the

Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons Claim 177; Page 158; 259pp; English.

WPI; 1999-009494/01

capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NRC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NRC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endomuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases A method has been developed for the identification of a nucleic acid

a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endounclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to are used to modulate gene expression in plant and mammalian cells and to caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepping asoites and infection. They may also be used to detect genetic drift and asoites and infection. They may also be used to detect genetic drift and antations in diseased cells and to determine c-raf RNA. Specifically NACS with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restencies, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugary/phosphate modifications increases tabbility against nuclease and activity. AAV090922 to AAV09317 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a polynucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcyrosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify

Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restenosis, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.

WPI; 1999-009494/01.

Thompson J,

Burgin A; Bellon

A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method comprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotides with up to 17 optionally modified nucleotides (nt), or their salts which are capable of binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "nuclectides modified with 2'-0-Methyl, and/or 2'-0-Propyl and/or 2'-Methoxyethoxy and or a peptide nucleic acid backbone"
structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of

This invention describes novel oligonuclectides with up to 17 optionally modified nucleotides (nt), or their salts which are capable of binding to a nucleic acid encoding an isoform of human tenascin, or a part of it. The oligonuclectides of the invention have antipsoriasis, antivitiligo, anticancer, anti-inflammatory and cardiovascular activity. The oligonucleotides are used to treat or prevent diseases associated with (over) expression of tenascin, particularly depigmentation (albinism, psoriasis or vitiligo), cancer or metastases, particularly melanowa, inflammation or cardiovascular disease (e.g. restenosis). A preferred application is treatment of vitiligo. The oligonucleotides may also be used for diagnosis of these diseases. AXX77925-X77981 represent the primers used in the method of the invention
                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense oligonucleotides that bind to sequences encoding human tenascin for treating depigmentation, cancer, inflammation and cardiovascular
a nucleic acid encoding an isoform of human tenascin, or a part of it. The oligonucleotides of the invention have antipsoriasis, antivitiligo, anti-inflammatory and cardiovascular activity. The oligonucleotides are used to treat or prevent diseases associated with (over)expression of tenascin, particularly depigmentation (albinism, psoriasis or vitiligo), cancer or metastases, particularly melanoma, inflammation or cardiovascular disease (e.g. restenosis). A preferred application is treatment of vitiligo. The oligonucleotides may also be used for diagnosis of these diseases.

```
hethod has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a Sallele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be use to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs.

The oligonucleotides are used to treat or prevent diseases associated with (over) expression of tenascin, particularly depigmentation (albinism, psoriasis or vitiligo), cancer or metastases, particularly melanoma, inflammation or cardiovascular disease (e.g. restenosis). A preferred application is treatment of vitiligo. The oligonucleotides may also be

The gene is expressed within vascular endothellum indicates a role for the polypeptides in the control of endothelial cell biology. The murine polymucleotide was identified from a white adipose tissue cDNA library. The polypeptide is useful for identifying receptors, which bind to and/or are activated by the polypeptide. The polymucleotide is useful in gene therapy of cerebral autosomal dominant ateriopathy with subcortial infarcts and leucoencephalopathy, an autosomal dominant disorder causing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAZ60922-23 were used to amplify cDNA encoding a murine polypeptide, which a member of the cell development cycle protein family known as the Delta family of mammalian membrane surface-bound ligands.
                                                                                                                                                                                                                                                                                                                                                                            Cell development cycle protein of delta family useful for treating various disorders associated with central nervous system e.g. cerebral autosomal dominant ateriopathy and ischemic strokes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence was used in methods for the modulation of ras expression. Antisense oligonucleotides were designed to specifically target mRNA encoding human H-ras, Ki-ras and N-ras. The oligonucleotides can be used to inhibit the proliferation of cancer cells and to prevent or treat a condition arising from the activation of a ras oncogene. They may also be used to modulate the expression of human H-ras or human Ki-ras. The antisense oligonucleotides may contain modified backbones, substituted sugar moleties and modified bases. The sequences preferably have a phosphorothicate backbone. They are preferably oligodeoxynucleotides or chimeric oligonucleotides containing 2'-O-methyl
                                                                                                                                                                                                                               antisense oligonucleotide; ras; H-ras; Ki-ras; N-ras; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                              The invention relates to a method of synthesising a repertoire of oligonucleotide tags of predetermined length. The method comprises providing a repertoire of oligonucleotide tag precursors in an amplicon, claaving the amplicon, ligating one or more oligonucleotide "words" to claaving the amplicon. Independent of the ends of each oligonucleotide tag precursors, and amplifying the oligonucleotide tag precursors in the amplicon. The cleavage, ligation and amplification of steps are repeated until a repertoire of oligonucleotide tags having the predetermined length is formed. The oligonucleotide tags having the predetermined length is formed. The oligonucleotide sequences (3-6 bases) can the specification are short oligonucleotide sequences (3-6 bases) selected from a minimally cross-hybridising set of oligonucleotides in which each "word" differs from every other member of the same set by at least two nucleotides. The invention also encompasses a repertoire of cloning vectors for attaching oligonucleotide tags to polymucleotides in which each of the vectors comprises a double stranded element corresponding to one of the oligonucleotide tags. The method and vectors can be used for the enzymatic synthesis of oligonucleotide tags may be used in a wide variety of research, medical, and industrial applications. e.g., diagnostic assays, screening for clones and novel target polymucleotides and identifying specific clones and novel target polymucleotides with polymucleotides. The method minimises the production of "failure" sequences within the tags, allowing encounted to he corred
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                            Novel method of synthesizing a repertoire of oligonucleotide tags of a predetermined length for the enzymatic synthesis of oligonucleotide tags.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tagged DNA sequences to be sorted. Sequences AAA14475-A14482 represent oligonucleotides used in an exemplification of the invention in the production of an oligonucleotide tag repertoire where each tag consists of 8 four-nucleotide "words". Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDF).
                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                             Ribozyme; erythropoletin; granulocyte colony stimulating factor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ribozyme; erythropoietin; granulocyte colony stimulating factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IR+2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

                                                                                                                                                                                                                                                       The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, ERR3/COUPTF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropojetin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CPP). The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/Or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of exprincement granulocyte colony stimulating factor protein and

Sequence 17 BP; 1 A; 8 C; 2 G; 6 T; 0 U; 0 Other;

Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUD-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of errythropoletin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production erythropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 erythropoietin; granulocyte colony stimulating factor;

                                                                                               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUD-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and interferon alpha
useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ribozyme; erythropoietin; granulocyte colony stimulating factor;

multiple number of Shear Stress Response Blements (SSRE) from various gene promoter sequences and one or more genes, antisense molecules, ribozymes, double stranded RNA, or a nucleic acid which encodes a repressor antibody or a mutant protein which inhibits the synthesis of, or activity of the protein or peptide. This sequence represents the SSRE sequence from the promoter of the platelet-derived growth factor A (PDGF-CA). The vector is useful for stimulating or inhibiting vascular endothelial cell or capillary endothelial cell proliferation and for endothelial cell or capillary endothelial cell proliferation and for estimulating analysis in cells. The vector or gene of interest is useful for modulating vascular permeability in a mammal, for stimulating or inhibiting the formation, maturation or regression of blood vessels, or inhibiting the formation, maturation or regression of blood vessels, and collabelial games or proteins involved in a diseases, down regulating angiogenesis and for treating vasculogenic and/or angiogenic disorders. These disorders include cardiovascular disorder, hypercholesterolaemia
factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;
                                                                                                                                                                                                                                                                                                                                  The present invention relates to enzymatic and antisense mucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, FAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and erychropoietly increases expression of) genes involved in the production of erychropoietin, granulocyte colony stimulating factor protein and interferon alpha
                                                                                                                                                                                              Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              erythropoietin; granulocyte colony stimulating factor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYM motif) pr an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; notropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; G-dleaver; amberzyme; zinzyme; Iymphoma; leukaemia; human; immunodeficiency virus; HIV associated NHL; lymphocytic leukaemia; human; immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; central nervous system injury; cherebrocherapy-induced neuropathy; amyotrophic lateral sclerosis; parkinson's disease; ataxia; Huntington's disease; muscular dystrophy; neurodegenerative disease. The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an NRM motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NRM motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to creat lymphoma, leukaemia, becall lymphoma, leukaemia, and inflammatory arthropathy The NGG-leukaemia, and inflammatory arthropathy The NGG-targetting nucleic acid is used to cleave RNA of the NGG gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the nucleic acid may be contacted with a cell to reduce NGGO activity of the cleave central nervous system (NGS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, and/or other neurodegenerative disease taxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of Sognerative disease creates which respond to the invention
                                                                                                                                                                   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                           Chowrira BM,

In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, apolipoprotein B (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentiln-1 (PSEN1) and presentiln-1 (PSEN1) and presentiln-1 (PSEN1) and presentiln-1 (PSEN1).
                    UDP-glucuronosyltransferase; amyloid precursor protein; presenilin-1; Alzheimer's disease; cytostatic; antisickling; antianaemic; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; gene therapy; adenosine deaminase deficiency; p53; beta-globin; retinoblastoma; BRCA1; BRCA2; CFTR; cystic fibrosis; cancer; Factor V; cyclin-dependent kinase inhibitor 2A; CDKN2A; melanoma; APC; HBA1; HBA2; adenomatous polyposis of the colon; Factor VII; Factor IX; thrombosis; haemophilia; alpha thalassaemia; haemoglobin alpha locus 1; MLH1; APOB;

The present invention provides single-stranded oligonucleotides which can be used for the targeted alteration of genomic sequences, where the oligonucleotide has at least one mismatch compared with the genomic sequence to be altered. In particular, these sequences are directed at the following genes: adenosine deaminase, p53, beta-globin, retinoplastoma, BRCA2, CFTK, cyclin-dependent kinase inhibitor 2A (CDKWA2), APC Factor V, Factor VII, Factor IX, haemoglobin alpha locus 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6, applipancedin E (APOB), LDL receptor (LDLM), UDP-glucuronosyltransferase (UGT1), amyloid precursor protein (APC), presentiln-1 (PSEN1) and presentiln-2 (PSEN2). These can be used in the gene therapy of diseases became according to the companies of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                                                                                                                                                               The present invention relates to detecting and identifying fungal pathogenic species in a sample. The method involves hybridizing a nucleic of a fungal pathogen possibly present in the sample with at least one oligonucleotide probe, from an Internal Transcribed Spacer (ITS) region. The method is useful for simultaneous detection and differentiation of clinically important fungi in a single assay, particularly Candida albicans, C. parapsilosis, C. tropicalis, C. kefyr, C. krusei, C. glabrata, C. dubliniensis, Aspergillus flavus, A. versicole, A. nidulans, A. fumigatus, C. neoformans and pneumocystis carinii. The method is especially useful in the detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    opportunistic infections in patients with impaired immunity systems, such as organ transplants patients, patients receiving intensive anticancer treatments, diabetics or AIDS patients
                                                                                                                                                                                                                                                                            nucleic
                                                                                                                                                                                                                                                           Detecting and identifying fungal pathogens, especially Candida,
Cryptococous and Aspergillus, comprises hybridizing the amplified nucle
acid of the fungal pathogen with a probe from the internal transcribed
spacer region of a DNA.

Diagnosing or prognosing an individual as being asthmatic by detecting for the presence of an unusual variant form, which is associated with increased tumor necrosis factor secretion, of a polymorphic sequence in chromosome 6p MHC region.

Example; Page 3; 8pp; English.

The present invention relates to a method for diagnosing or prognosing an individual as being asthmatic, or as having a predisposition to asthma. The method comprises demonstrating in the individual the presence of an unusual variant form of at least one polymorphic sequence in the major histocompatibility complex (MHC) region of chromosome 6p, where the nistocompatibility complex (MHC) region of chromosome 6p, where the nerossis factor (TNP). The method is also useful for predicting the clinical course of asthma, both in individuals and across populations. This may be used to identify asthmatic individuals who may respond to treatment directed against TNF or other pro-inflammatory molecules which interact with TNF. The present sequence is a probe for TNF-308 allele 1. This probe was used to illustrate the present invention

Generating plants resistant to cucumber green mottle mosaic virus infection, comprises transforming a plant with a polymucleotide that when expressed produces resistance against infection and does not produce replicase activity.

Example 1; Page 20; 88pp; English.

PCR primers AAF54960-63 were used to amplify DNA encoding the coat proteins of cucumber green mottle mosaic virus (CGMMV) isolates. The amplified sequence was used to produce a DNA construct which, upon transformation into a plant and transcription into RNA, generates resistance against infection with CGMMV in the plant, and does not lead to generation of any replicase activity in the plant. The method is useful for protecting plants susceptible to CGMMV infection and for generating resistant plants against CGMMV, particularly those plants of the Cucurbitaceae family

Apparatus and method for performing a large number of chemical and biological reactions by bringing two arrays into close apposition and allowing reactants on the surfaces of the two arrays to come into contact

Example 11; Fig 18B; 112pp; English.

comprises a first solid support with a reactant of each reaction immobilised on to it, and a second solid support either providing a second reactant confined to a specific area on the surface, or a chemical second reactant confined to a specific area on the surface, or a chemical second reactant confined to a specific area on the surface, or a chemical mechanical separation of the reactions, where the first and second solid supports are assembled to provide an environment for performing the reactions in parallel. The methods and apparatus are useful for performing a large number of chemical and biological reactions, especially polynucleotide amplification reactions and the detection of sequence variations, expression levels and their functions. The method is capable of generating large amounts of data or products per unit time by carrying out large numbers of reactions in parallel. The process is also amenable to full automation. Sequences AAF81164-179 represent probes used in detecting amplified products by allele specific extension, the products amplified by performing large numbers of PCR reactions using array-immobilised and releasable primers invention provides a novel system for performing reactions, that

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to generating resistance in a plant or plant cell against infection with Cucumber Green Mottle Mosaic Virus (CGMWV) comprising providing the plant or plant cell with a polynucleotide sequence (NI) that, upon transformation into a plant and transcription into RNA, either generates resistance against infection with CGMWV or, optionally, does not generate replicase activity. (NI) comprises first on second DNA sequences. The first DNA sequence comprises a promoter, operably linked to a first DNA region, which is capable of being transcribed into a sense RNA molecule with a nucleotide sequence comprising a sense nucleotide sequence of at least 10 consecutive nucleotides having between 75 and 100% sequence identity with at least part of the nucleotide sequence of the genome of the CGMWV, capable of infecting the plant or the plant cell. Optionally, a DNA region is involved in transcription termination and polyadenylation functioning in plant cells and the second chimacric DNA comprises a promoter, operably articals by a plant cell of being transcribed into an artical or the plant cell of plant cells and the second chimacric DNA comprises a promoter, operably articals by a plant cell of plant cells and the second chimacric DNA comprises a promoter, operably articals by a plant cell of being transcribed into an

The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1
                       or seedlings for a plant. The method is useful for generating resistance against CoMMV in plants, which are susceptible to infection which COMMV, such as Cucurbitaceae species, e.g. melon (cucumis melo), cucumber (C. sativus), watermelon (Citrullus vulgaris) or bottlegourd (Lagenaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, for raising antibodies that recognize hGDWLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDWLP-1.

nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specific blomolecule capture probes for surface-enhanced laser desorption ionisation, as the rapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines of for replacement therapy. The production and in vaccines of for replacement therapy. The production with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed to the wind the capture of the prise of the printed of the mino, in the warm of the present invention. N.B.

The sequence data for this patent did not form part of the printed of the mino, in the warm of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; wuscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Shannon ME;

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify nucleic acids in samples, as amplification substrates, to hGDMLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing in onisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The disorder associated with the expression of hGDMLP-1, in particular heart man an insclede disorders. hGDMLP-1 is localised to chromosome 22.

                                                                                  04-OCT-2000;
        protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the rapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence in the assemblification of the present invention. N.B.
                                                                                                                                                                                                                                                                                                 The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1
                                                                                                                                                                                                      New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 (an be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein substrates, and for capture simmunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically proteins, as specifically in the concentration and/or amount specifically proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionization, as therapylement in patients having specific deficiency in hGDMLP-1 production, and in vaccines encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. hGDMLP-1 sequence data for this patent did not form part of the printed concentration in the sequence data for this patent did not form part of the printed concentration in the concentration of the present directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunosens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The concentration of selectal muscle disorders. hGDMLP-1 my be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart of supersont sections of the present invention. and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                Human, genome-derived myosin-like protein 1; GDMLP-1; hGDMLP-1; heart; muscle; myosin; chromosome 22; gene therapy; vaccine; heart disease; skeletal muscle disorder; amplicon; screening; ss.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 calcable as probes to detect, characterise and quantify hGDMLP-1 mucleic acids in samples, as amplification substrates, to protein variants having desired phenotypic improvements, and for protein variants having desired phenotypic improvements, and for sexpressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as and/or amount specifically of hGDMLP-proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular hart and sheat seminance represents hGDMLP-1 is localised to chromosome 22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ftp.wipo.int/pub/published_pct_sequence

Chen W, Rank DR, Hanzel DK, Gu Y, Ji Y, Penn SG, WPI; 2002-179446/23. New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure; SEQ ID NO 2033; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polymuclectide sequences of hGDMLP-1 con be used in gene therapy and vaccine production. The hGDMLP-1 mucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired henotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as specific ally recognise hGDMLP-1 proteins, as specifically recognise hGDMLP-1 proteins, as specifically of hGDMLP-1 proteins, as specific blomolectule and/or amount specifically of hGDMLP-1 proteins, as specific blomolectule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed control of the present invention. ftp.wipo.int/pub/published\_pct\_sequence

```
Lue invention relates to an outgonnicecture for targeted alteration of a protein genetic sequence, which comprises a single-stranded oligonuclectide having a DNA domain. The DNA domain has at least one mismatch with crespect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications of the oligonucleotide are combination of any two or more phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for directing repair or alteration of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved cutitional value (e.g. altering amino acid content of plants or conferring amino acid content of plants or conferring amino acid cortent of plants or conferring amino acid over production), herbicide resistance (e.g. olyphosate resistance, imidazolinone and sulphonylurea herbicide resistance, conferring expance, indiazolinone and sulphonylurea herbicide resistance.

C. Glyphosate resistance, modified oil production, modified starch production (e.g. increased starch or production), altered floral content carduced palmitate, increased stearate or reduced linolenic acid).

C. G. g. increased plamitate, increased stearate or reduced linolenic acid).

C. G. g. the oligonucleotides are also useful for producing albino mutants for the analysis of photosynthetic processes. This sequence represents a genome analysis of photosynthetic processes. This sequence represents a genome analysis of photosynthetic processes. This sequence represents a genome content of the invention and subino mutants for the analysis of photosynthetic processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an oligonucleotide for targeted alteration of a genetic sequence, which comprises a single-stranded oligonucleotide having a DNA domain. The DNA domain has at least one mismatch with respect to the genetic sequence to be altered and further comprises chemical modifications of the oligonucleotide. The chemical modifications or is the oligonucleotide. The chemical modifications obsolved the phosphorothicate linkages on a terminus, or a combination of any two or more of these modifications. The oligonucleotides are useful for more of these modification of plant genetic information. The oligonucleotides are particularly useful for creating plants with desired phenotypes, e.g. environmental or abiotic stress tolerance, improved nutritional value (e.g. altering amino acid content of plants) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              conferring amino acid over production), herbicide resistance (e.g. gryphosate resistance, imidazolinone and sulphonylurea herbicide resistance, porphyric herbicide resistance or triazine resistance, disease resistance, modified resistance or triazine resistance, disease resistance, modified oil production, modified starch production (e.g. inncreased starch or production of waxy starch), altered floral morphology (e.g. male-sterile plants) or modified fatty acid content (e.g. reduced palmitate, increased stearate or reduced linolenic acid). The oligonuclectides are also useful for producing albino mutants for the analysis of photosynchetic processes. This sequence represents a genome altering oligonuclectide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chromosomal genomic alteration; genome altering oligonucleotide; PCR; ss; o-methyl modification; LNA modification; phosphorothioate linkage; DNA repair; DNA alteration; environmental tolerance; hygromycin-B; abiotic stress tolerance; improved nutritional value; hygromycin; primer; amino acid over production; herbicide resistance; glyphosate resistance; imidazolinone herbicide resistance; sulphonylurea herbicide resistance; porphyric herbicide resistance; triazine resistance;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotides with modified nuclease-resistant termini, useful for creating plants with desired phenotypes, e.g. stress tolerance, improved nutritional value, herbicide or disease resistance, or modified oil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.6%; Score 12.2; DB 1; Length 17; 82.4%; Pred. useful Novel isolated human testis expressed Patched like protein (HTPL), use for identifying agonist and antagonist and specific binding partners, for treating subjects having defects in HTPL.

Example 2; Page 302; 718pp; English.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The shares an overall structure organisation with the Patched protein. The cotat of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome loppi2.1. HTPL and ist coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of the second second sequence as useful for disorders shoulded disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful disponsitic markers and potential therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an example from the invention

Sequence 17 BP; 7 A; 2 C; 5 G; 3 T; 0 U; 0 Other;

Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 106; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's maxcoma, melanoma, conditions selected from cancer, lymphoma, Ewing's maxcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, wertuca tumour angiogenesis, diabetic retinopathy, macular degeneration, vertuca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Neber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnosit to to detect the presence of ERG RNA in a cell. (I) is useful for specifically the presence of ERG RNA in a cell. (I) is useful for specifically tracement of ERG RNA in a cell. (I) is useful for specifically carged molecules within regulate expression of ERG, and enzymatic nucleic acid molecules within regulate expression of ERG, and enzymatic nucleic acid molecules within regulate expression of ERG, and enzymatic nucleic acid molecules within regulate expression of ERG, and enzymatic nucleic acid molecules within regulate expression of ERG, and

Novel polynucleotide which down regulates expression of Ets-related geruseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 61; 149pp; English.

Expression of an Ets-related gene (ERG). (I) is useful for treating expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, theorem angiogenesis, diabetic retinopathy, macular degeneration, convacular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge vulgaris, angiofibroma of tubercous sclerosis, port-wine stains, Sturge vulgaris, angiofibroma of the parient syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemocherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting (I) is useful for reducing ERG activity in a cell, or the expression of ERG, and as diagnostic tool to contact or the expression of ERG, and as diagnostic tool to contact or the contact or the contact or the contact or the cell or the contact or conta the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention

```
The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, Imphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, extensions, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu Syndrome, leukaemia, osteoporosis and wound healing, (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in champharany regarment (I); eventual for the reduction or more therapies under syndrome or more therapies under syndrome or more therapies under syndrome.
                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid molecule (I) which down regulates expression of an Bts-related gene (BRG). (I) is useful for treating conditions selected from cancer, 'Imphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of BRG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (RG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel polynucleotide which down regulates expression of Ets-related gene,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA ocation by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically transcence that share homology with ENG gene or ERG funion genes. ABK13354-ABK22719 represent nucleic acids, including antisense and argymatic nucleic acid molecules which regulate expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Randi AM;

Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 71; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, or ulgarish, angiofibroma of tuberous sclerosis, port-whose stains, Sturge weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or communition with one or more of other therapies such as radiation or communities by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cell, by contacting the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically tracement of ERG RNA in a cell. (I) is useful for specifically traceting genes that share homology with ERG gene or ERG fusion genes. ABKI7354-ABK22719 represent nucleic acids, including antisense and carginatic nucleic acids molecules which regulate expression of ERG, and enzymatic nucleic acids, including antisense and enzymatic nucleic acids, including antisense and enzymatic nucleic acids, including antisense and related PCR primers of the invention

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gent therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence repersents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid encoding an isoform of human pregnancy associated plasma protein E, for preventing or aborting pregnancy
                                                                                                              Human PAPP-Ea associated 17-mer SEQ ID 467.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 2; Page 136; 353pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to methods for identifying a test substance that modulate the immune response in a genotype specific manner. Methods of the invention involve genotyping subjects to identify those having a genotype (e.g. interleukin-1; IL-1) associated with one or more inflammatory disease-associated genotype and observing a biomarker in the subject before and after the subject is contacted with the test substance. The methods or cells associated with inflammatory diseases are useful for identifying a substance that is likely to prevent or diminish a specific biological response in subjects having inflammatory disease. To one or more of periodontal disease, coronary artery disease, associated genotype, where the genotype is associated a pre- disposition or more of periodontal disease, coronary artery disease, diabetic retinopathy, end stage renal disease, diabetic diabetes diabetic retinopathy, end stage renal disease, disease, ophthalmopathy, extrathyroid disease, systemic lupus erythematosus, cophthalmopathy, extrathyroid disease, systemic lupus architics, cancer, ulcerative colitis, asthma, interstitial lung disease, invention also relates to a kit comprising primers for the identification of sused for amplifying tumour necrosis factor (TNF, -308) DNA. This probe is used in the associated sectors are the probe in the proper invention also relates to a kit compressed to a probe which is used for amplifying tumour necrosis factor (TNF, -308) DNA. The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence of 671, (CC acids (S1, ABB8399), a sequence having 65% sequence of 671, (CC acids (S1) having 95% deviations, especially conservative substitutions or a (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsses as well as community as a useful for dagnosing, manitoring disease and treating contentifying a specific binding partner. (I) and nucleic acids (II) cc reating cancer, they useful for dagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including disquosing and crusting in suseful for measuring and for surveying gene expression and oreating creating cancer, they useful in the development of vaccines and (II) is useful for measuring and for surveying gene expression and oreating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomolectide useful in examples of the invention. Note: The present sequence did not form part of the priment by the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; POSHL 1; SH3 domain; POSH-like signalling protein 1; oncogene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 2; SEQ ID NO 1429; 60pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.6%; Score 12.2; DB 1; Length 17; 82.4%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (G1, ABBB3999), a sequence having 55% sequence identity to (S1), acids (G1), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene, oncoduct that functions as an adaptor protein that interacts with Rho family small GTBases as well as downstream components of the signal transduction pathway. (I) is useful cor identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and creating caused by altered expression of human and or susting microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomorlocitide useful in examples of printed specification, but is based on sequence did not form part of the printed appears to the present sequence of printed specification, but is based on sequence information supplied to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 consiguous amino acids. Human PoSHL 11s a proto-oncogene/Oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence identity to (SI),

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (SL), ABB83999), a sequence having 65% sequence identity to (SL), (SL) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an edaptor protein that interacts with Rho family small GTPases as well as commistram components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) concoded by altered expression of human POSHL1 including diagnosing and crasting caused by altered expression of human POSHL1 including diagnosing and crasting caused by altered expression of human POSHL1 including microarraps which are useful for measuring and for surveying gene expression and creating care therapy. (II) is useful for constructing microarraps which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the constitution, but is based on sequence information supplied to between by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (SL, ABBA399), a sequence having 61% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 11 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for idagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and caused by altered expression of human POSHL1 including diagnosing and caused by altered expression of human POSHL1 including diagnosing and creating caused by measuring and for surveying gene expression and creating are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning ollgonucleotide useful in examples of the invention. Note: The present sequence did not form part of the privent by the European Patent Office

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful of or identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and creating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating research is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the present sequence is that of a scanning oligomucleotide useful in examples of the invention. The invention relates to an isolated SH3 domain (POSH)-like signalling action relates to an isolated SH3 domain (POSH)-like signalling action (S1, ABB83999), a sequence having 65% sequence of 730 amino acids (S1, having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSH1 lisa proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and mucleic acids (II) encoding (I) are useful for diagnosing, monitoring disease and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the harmon harmon and present non-harmon size based on sequence information supplied to harmon harmon as a based on sequence information supplied to harmon harmon and present of producing them to the present of harmons harmon ha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                            Human, POSHL 1, SH3 domain, POSH-like signalling protein 1, oncogene, Rho GTPase; signal transduction, gene expression, cancer, vaccine; gene therapy, transgenic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 2; SEQ ID NO 823; 60pp + Sequence Listing; English.

diagnostic first particular and the properties of the sequence comprising at least 8 contiguous amino or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 11s a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsses as well as downstream components of the signal transduction pathway. (I) is useful of the indirection pathway. (I) is useful of the indirection pathway. (I) is useful or caused by altered expression of human POSHL1 including disease and traating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to
                                                                                       730 amino
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17 BP; 3 A; 9 C; 2 G; 3 T; 0 U; 0 Other;

Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1. The invention relates to an isolated SH3 domain (POSH)-like signalling Example 2; SEQ ID NO 1426; 60pp + Sequence Listing; English

protein 1 (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABB8399), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Grasses as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) concoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful for mesauring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the prime by the European Patent Office

Human POSH1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSH1 including disease and treating caused by altered expression of human POSH1 including disease and treating treating cancer, they useful in the development of vaccines and (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The

present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL-1, useful for treating disorders associated with decreased expression or activity of human POSHL1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human POSHL I is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small Gyrases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) encoding (I) are useful for diagnoshing, monitoring disease and treating caused by altered expression of human POSHLI including diagnosing and treating caused by altered expression of human element of vaccines and (II) is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           protein 1 (POSHL 1) polypeptide (II, comprising a sequence of 730 amino acids (S1, ABB83999), a sequence having 65% sequence identity to (S1), (S1) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated SH3 domain (POSH)-like signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, POSHL 1, SH3 domain, POSH-like signalling protein 1, oncogene, Rho GTPasë; signal transduction, gene expression, cancer, vaccine;
                                                                                                                                                                        Gaps

useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligomucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to Derwent by the Buropean Patent Office
                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                    .

Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL -1, useful for treating disorders associated with decreased expression or activity of human POSHL1.

Example 2; SEQ ID NO 1425; 60pp + Sequence Listing; English.

The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSH1 1) polypeptide (1), comprising a sequence of 730 amino acids (SI, ABBB3999), a sequence having 65% sequence identity to (SI), (SI) having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSH1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II)

```
encoding (I) are useful for diagnosing, monitoring disease and treating caused by altered expression of human POSHL1 including diagnosing and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to
                                                                                                                                                                                                                                                                                                               ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid sequences associated with tumor suppression, regression, apoptosis or virus resistance are useful to diagnose and treat viral disease, development of tumor cells and cell degeneration.
the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, continosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCAI RNA in a cell. This sequence represents an enzymatic nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents an isolated nucleic acid sequence associated with tumour suppression or regression, apoptosis or virus resistance. invention relates to these sequences or sequences having at least 80%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 identity to them, and polypeptides encoded by the sequences or polypeptides having 80% identity to the polypeptide sequences. The invention is used to diagnose or treat viral disease or disease characterized by development of tumour cells or cellular degeneration
                                                                                                                                                                                                                Gaps

```
The invention relates to a composition comprising an oligonucleotide which is targeted to a nucleic acid encoding human ras, which is capable of inhibiting ras expression, and at least one chemotherapeutic agent. The composition is useful for modulating the expression of human ras in tissues or cells containing a ras gene. The compostion is also useful for inhibiting the proliferation of cancer cells, where the cancer cells are blood cells, preferably peripheral blood monounclear cells. The composition is useful for treating or preventing a condition arising from the activation of ras oncogene which involves contacting an animal suspected of having a condition (e.g. hyperproliferative condition such as cancer preferably colorectal cancer, melanoma, liposarcoma, mesochelioma, sarcoma, colon cancer or pancreatic cancer) arising from the activation of ras oncogene such as abnormal expression of the ras
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Composition comprising an antisense oligonucleotide targeted to nucleic

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. WPI; 2003-313353/30.

Disclosure, Page 34; 720pp, French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti) sense reagents, and for propreptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for component of pharmaceuticals for prevention and/or treatment of vixal diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schipseptides can also be used to generate antibodies, and companient samples is useful for disponsis and/or prognosis of these companies. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression contracted human fukutin oligonucleotide of the invention

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. 

Disclosure; Page 716; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that calignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridises to them under highly stringent conditions, or the complement of acids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, celts containing the polypeptides, and so prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell cogeneration, specifically cancer but also Alsheimer's disease and shipsis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these characterised by development of operation and solventing and obth the polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene cherapy. This polypuclacides deserved to represent a tumour suppression related human fighting of the invention can be used in gene cherapy. therapy. This polynucleotide sequence represents a rumc related human fukutin oligonucleotide of the invention

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear regulates expression of a sequence encoding a subunit of nuclear configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A.

(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oseophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edarrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edarrexate, colomicatabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft crejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and mycoardial, repenced any inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic

The enzymatic nucleic acid molecule is adapted to treat treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2'+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel enzymatic nucleic acid molecules which down regulates expression of

prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug cherapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including pacitaxel, docetaxel, ciaplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edarrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edarrexate, cold molecules are also useful for treating inflammatory disease such as thematoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allengic alivay inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

Shannon M, Gu Y, Nguyen C;

New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.

Example 8; SEQ ID NO 549; 103pp; English.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12, MDZ3 is encoded at chromosome GP21.1, MDZ4 is encoded at chromosome GP21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p11.2 and MDZ12 is encoded at chromosome 15p11 and MDZ12 is encoded at chromosome 15p11 and MDZ12 is encoded at chromosome 15p11 and MDZ12 is encoded at chromosome 15p21.2 and MDZ3, MDZ1, or MDZ12, e.g. cancer or developmental disorders. The nucleic

acids and proteins are also useful for diagnosing or monitoring a diseas caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention. 8888888888

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is concoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 6p21.3 and MD212 is encoded at chromosome 6p21.3 and MD212 is encoded at chromosome 6p21.3-22.2, MD24. MD24, MD27, and MD212 sequences are useful in therapy. Corin manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids and also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as constructing sequence was used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7922.1, MD24 is encoded at chromosome 15021.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p11.2 or preventing a chromosome 15p2.2 is encoded at chromosome 15p2.2 is encoded at chromosome 15p2.2 is encoded at chromosome 15p2.2 is and MD212 is encoded at chromosome 15p2.2 is encoded expression or exerting or floating at isorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.6%; Score 12.2; DB 1; Length 17; 32.4%; Pred. ```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is conceded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome 16p21. The MDZ4, MDZ7, MDZ4, MDZ7, encoded and MDZ1 is encoded at chromosome 16p22 associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The useful in constructing microarrays for measuring gene expression. The present sequence was used to illustrate the invention.
New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.6%; Score 12.2; DB 1; Length 17; 32.4%; Pred. proteins and their coding sequences: MDZ3, MDZ1, MDZ12. MDZ3 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 6p21.2 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ4; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;
                                                                                                                                                                                                                                                                                                                                                                    New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to novel human zinc finger-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 0.6%; Score 12.2; DB 1; Length 17; Best Local Similarity 82.4%; Pred. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ2. MDZ3 is cncoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.2, MDZ7 is encoded at chromosome 6721.2, and MDZ12 is encoded at chromosome 722.2, MDZ7 is encoded at chromosome 6721.2 and MDZ12 is encoded at chromosome of 672.3 and MDZ12 is encoded at chromosome 672.2, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ4; MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;
                                     New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3,
